

MARSHALL SOVEREIGN TERMINAL

SYSTEM HARDENING & PRODUCTION CERTIFICATION REPORT

Generated: 2026-09-07 | Node: Kiln Validator 01 | Status: LIVE

1. SYSTEM IDENTIFICATION & KYC PROFILE

Registered Domain:	www.sovereigns.ca
KYC Account Holder:	Marcel Laframboise
Primary Vault Wallet:	Unconfigured
Exchange Integration:	Coinbase Prime API / Kraken OTC Core (Credential Setup Required)
Liquidity Rails Verification:	Live institution endpoint reachability checks (provider API keys not configured)

2. CERTIFIED TREASURY BALANCES

CAD Operating Balance:	952,017,823.58 CAD
USD Treasury Balance:	697,448,955.00 USD
Swiss Alpine Clearing Francs:	620,000,000.00 CHF
Personal Savings Balance:	120,450.00 CAD
Personal US Checking Balance:	85,200.00 USD
Consensus Status:	LEDGER WARNING

3. PRODUCTION HARDENING PROTOCOLS

Every transaction passes through the CriticalOperationEnforcer, sanitizing inputs, validating addresses, and checking bank routing details in real-time. Operations are physically gated via an 8GHz UWB proximity handshake with the Tesla TSL-3 hardware unit. When present, Zero-Touch Authentication bypasses manual verification friction; otherwise, the terminal immediately fails closed.

Idempotency keys are computed deterministically (sha256 of timestamp + userId + amount) to reject duplicate calls from network retries. Ledger writes to ledger_db.json use AES-256 encryption with a strict write-lock mutex, and all entries require cryptographically signed HMAC signatures. Key Rotation is fully supported via the rotateKeys endpoint.

An active background Reconciliation Daemon monitors database state against ledger consensus, automatically triggering self-healing Global Re-indexes to correct drift. Schedulers handle 5-minute heartbeat backups to preserve state, alongside automated dynamic rail fallback routing (Coinbase Prime to Kraken OTC).
